

# Twin Garden Farms

Featuring TGF Mirai® Sweet Corn

## ***Congratulations!***

You have the opportunity to grow the best sweet corn hybrid-bar none. Treat this seed right and you will be the Master Gardener amongst your peers.

### PLANTING TIPS

- You need to have a well prepared seedbed and continued good conditions.
- It must be warm when you plant soil temps should be 55-60 F.
- Plant shallow, no more than 1 1/4 inch.
- Push the limits of the university recommended fertility in your area.
- It is best to plant multiple rows rather than one long one for pollination purposes.
- We wait until the planted TGF Mirai® begins to peak out of the soil and then we know it is time for the next planting.
- Rows should be approximately 30" apart and seeds spaced about 8 inches in the row.
- At harvest ears should be allowed to mature fully for maximum flavor and sweetness, 21-24 days after silking. Harvest maturity is the most critical step for TGF Mirai® as the key to the overall great eating experience is picking it just right. I recommend 0 or +2 on the chart. Please check our Maturity Chart on page 2 of this document for assistance.

**Great Gardening!**
